Scott's

a part of
Pittsburgh
for over
80 years.....

Pittsburgh grows at a fabulous rate these days and Scott's, at home here since 1876, keeps step! In this connection, it pleases me to announce my association with this fine, highly regarded store.

While you will see many changes that spell better service, basically there will be no change in the high quality merchandise we offer . . . that, as always, will be the finest the market affords.

One thing more, won't you let me know how you like Scott's after you have had a chance to look us over? And, if you have ever had an experience here that in any way proved disappointing, please let me know about that, too, so we can work out a satisfactory adjustment.

I'll look forward to hearing from you.

Sincerely,

JOHN F. BEGGY, *President*

ARTICHOKE, FRENCH

This highly prized salad can be grown in our climate, provided the plants are given light protection over winter. Start the seed indoors and give the same treatment as you would tomatoes, transplanting to the garden in May. The plants are perennial.

An ounce of seed will produce 500 plants

Large Green Globe. The best variety. Pkt. 15 cts., 1/2 oz. 60 cents., oz. \$1.00, 1/4 lb. \$3.00.

ASPARAGUS

Equally good results may be secured by planting seed or roots; seed is cheaper but from one to two years' time is saved by starting with roots.

Sow seed early in the spring, in shallow drills 12 to 15 inches apart, and when the plants are 4 inches high, thin out to 3 inches apart; transplant to the permanent bed the following spring.

An Asparagus bed should be deeply dug and plenty of manure worked in. Set the plants so that the crown is about 3 inches below the bed-level, in rows at least 3 feet apart and 1 1/2 to 2 feet apart in the row. Barely cover at first, filling in as the plants grow. Do not cut the first year.

One ounce of seed will sow a 100-foot row;
5 pounds will sow an acre

Mary Washington. ★ Plants vigorous, very productive and nearly rust-free. Shoots dark green with heavy purple overtone and of excellent quality. By far the most extensively grown variety. **Seed,** pkt. 15 cts., oz. 35 cts., 1/4 lb. \$1.00, lb. \$3.00.

Two-year-old roots, 95 cts. per doz., \$2.75 for 50, \$5.00 per 100.

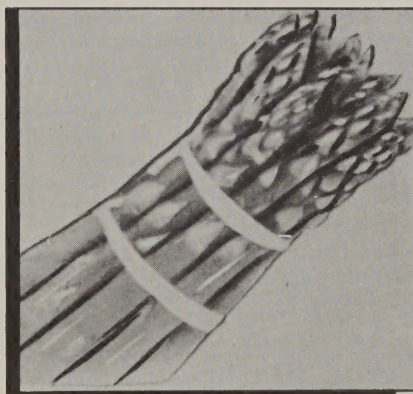

BEANS

Dwarf Green-Podded and Wax Beans

Although the pods of Wax Beans are considered more attractive than those of the green-podded sorts, there is no difference in quality, and personal choice, or market demand, must decide which to grow; both are delicious and both yield bountiful returns from limited space. Home gardeners will want some of both types. As soon as the ground warms up, plant the Beans 1 1/2 to 2 inches deep and 2 to 3 inches apart in rows 2 to 2 1/2 feet apart. Later plantings should be covered 2 1/2 to 3 inches deep. For a constant supply, plant every two weeks from May to August.

For Increased Yield Inoculate This Seed with LEGUME-AID.

A pint of seed will sow 150 feet of furrow; 1 to 1 1/2 bushels, depending on variety, will be required for an acre when the seed is planted in drills.

Mary Washington.

CAULIFLOWER

Sow the seed and treat the young plants exactly as you would cabbage, starting the spring crop in flats indoors or in the hotbed early in February and transplanting to the garden in May after danger from frost is past. Sow for fall crop in coldframe or seedbed in May and transplant in June. Set the plants 1½ feet apart, digging in plenty of manure if it is available. When the plants show signs of heading, water them freely. Finally, when the heads are about 2 inches in diameter, tie the outer leaves loosely together over the top with soft twine, to protect them from the sun and blanch them white. Days to maturity are from the time the plants are set in the garden. Allow about 30 days to produce the plants from seed.

CELERY

Celery wants plenty of fertilizer—enrich the spot where you are going to grow it with manure, humus, or rich compost, or if you lack these, with a commercial fertilizer high in nitrogen. For early crops sow indoors or in a hotbed about April 1, barely covering the seed with soil. When the seedlings are 2 to 3 inches high, thin out or transplant 1½ to 2 inches apart. Set out by the end of May. For winter Celery, sow seed in a coldframe or sheltered spot in the garden about mid-April and reset in the trenches about July 1. It is a good plan to cut off the tops of the plants when they are 4 to 5 inches high to make them more stocky.

Days to maturity are figured from the time the plants are set in the garden

An ounce of seed will produce about 7,500 plants

SWEET CORN

Do not make the first sowing until the soil is warm and comparatively dry—the middle of May is usually the earliest it is safe to sow Corn in this section. Plant every 2 weeks until early July. It can be grown in hills or in rows. Hills are placed 2 to 3 feet apart each way, dropping about six seeds in each hill and, when the plants are about 8 inches high, pulling out all but the three or four strongest. Rows are spaced 2 1/2 to 3 1/2 feet apart and the plants thinned to stand 12 to 15 inches apart in the rows. In planting, cover the seed about 2 inches deep. In order that the ears may develop perfectly they must receive plenty of pollen from near-by stalks; consequently, it is always best to plant Sweet Corn in several short rows, side by side, rather than in one or two long rows. If you want to enjoy Sweet Corn far sweeter and richer than any you have ever been able to buy, grow it yourself and pick it just before it is to be cooked.

Sow the main crop directly in the garden late in May, and, for a continuous supply, make additional sowings every two weeks up to the middle or latter part of July. Prepare hills 4 to 6 feet apart, digging up the soil to a depth of a foot or more and mixing in plenty of manure or compost. Leave the soil in the hills loose and a little higher than the general level of the garden. Sow eight to ten seeds in each hill and thin out all but the strongest three or four plants. Do not disturb the vines after they have started to spread. If the striped beetles interfere with the development of the young plants, spray them with Nicotine Pyrox or dust with Rotenone Dust. PEAS

Laxtonian.

Peas can be sown very early in the spring, the early smooth-seeded varieties even as early as March 1. For the first sowings use the smooth or round-seeded sorts, but after the first of April change to the wrinkled kinds which, although not so hardy, are much superior in quality. Make additional sowings every two weeks up to June 1, for a continuous supply, but arrange to put the later plantings on deep, rich soil where you can conveniently water them during dry weather. Plant dwarf varieties in rows 2 to 2½ feet apart, tall varieties about 3 feet apart. Cover both kinds about 2 inches and thin to stand 3 inches apart in the row. The tall varieties do best for late planting, and while some people prefer to provide supports for them they are really not necessary.

For Increased Yield Inoculate This Seed with LEGUME-AID.

A pint of seed will sow 100 feet of row; 1 to 1½ bushels will sow an acre.

Planting Tip:

The best way to sow small seeds is to take a few in the hand, and let them fall through the fingers, into the drill which has been prepared. Get close to the ground. With a little practice, you can quickly acquire control so that the seeds will be evenly distributed. It helps to mix the very small seeds with dry sand before you sow, using two or three times as much sand as seed.

RADISHES

Start outdoors as soon as the ground can be put in shape and sow seed of any of the quick-growing round or olive-shaped sorts, not too thick, in drills $\frac{1}{2}$ inch deep and 1 to $1\frac{1}{2}$ feet apart. Thin out the seedlings promptly to stand about an inch apart in the rows. If not thinned out they will only produce tops and not develop a bulb. After putting in seed for the first crop, make additional sowings every ten days to two weeks, but for the later crops, which will ripen in warm weather, use the long varieties.

For late summer and fall use, sow the Summer and Winter Radishes which are larger and slower growing but will, unlike the early round Radishes, thrive in hot weather. The Summer Radishes may be sown any time up to August 1. The big Winter Radishes should be sown late in June to attain full size before frost.

One ounce of seed will sow about 100 feet of drill; 8 to 10 pounds will sow an acre.

Rutgers.

TOMATOES

The seed should be sown indoors in late February or March, in shallow boxes or pots placed in a warm, sunny window. As soon as the little plants are strong enough, thin or transplant them to stand 3 to 4 inches apart; then when they are about 3 inches high transfer them to small paper pots or dirt-bands. To secure extra-strong, stocky plants, transfer them again, when 6 to 8 inches tall, to larger pots. When all danger from frost is past, set them out in the garden, about 4 feet apart each way.

Treat the seed with Semesan to prevent damping-off of seedlings. Use Transplantone when transplanting the plants to the garden. (See fertilizer pages.) To guard against blight, spray or dust the plants with a copper fungicide frequently during the season; arsenate of lead or DDT will kill the Tomato worms.

Days to maturity are figured from the time the plants are set in the garden.

An ounce of seed will produce about 2,000 plants.

Start seeds indoors in a shallow box filled with vermiculite or light, rich soil which is not likely to bake nor form a crust when dry. Treat it with Formaldehyde or Semesan. Tamp firmly, until level is $\frac{1}{2}$ " below the top of the box. Dig shallow furrows crossways, approximately 1" apart. Sow the seed thinly, and label each row. Cover with fine soil, mixed with sand. After pressing the surface with a board or brick, sprinkle very finely; a whiskbroom

dipped in water does a good job. Use a sheet of glass and newspaper to cover the box, which should be set in a warm place.

From day to day, look at the box to make sure that the surface does not become dry or soggy.

When the seedlings break through, remove the newspaper and set the box to receive maximum sunlight. As soon as the first leaves are

fully formed, remove the glass, or tilt it to admit air. Take off the glass when seedlings are all up.

Transplant one time before moving to garden.

Perennials may be handled the same way, after annuals are coming along.

Most annuals can be sown outdoors anytime from early April to June.

PANSIES

The best results are secured by sowing in late July or August and protecting the young plants over winter with a covering of straw manure or a deep blanket of leaves. They will then be ready to begin blooming as soon as the weather opens up in the spring and will continue to flower until hot weather. The next best time to sow is very early in the spring, in February or March, starting the seed in a box indoors or in a coldframe and setting the plants outdoors the latter part of April. If set out in a spot that is shaded part of the day, where the soil is deep and moist, and the flowers picked daily, the plants may be kept blooming all summer.

Sow I. W. SCOTT Company's *Famous* **LAWN SEED** *Mixtures...*

"PURITY" Lawn Seed

This is the lawn seed mixture that we recommend for general use. It has been planted for many years and has proved to be very satisfactory.

The base of this mixture is Kentucky Blue Grass, in the finest recleaned grade. Red-top, Poa trivialis and Certified Perennial Rye Grass have been added, and together these splendid grasses produce a turf of rich, even green color. Such a lawn can withstand hot dry summers, cold winters and wet autumns and springs.

1/2 lb.	\$0 60	10 lbs.	\$ 9 95
1 lb.	1 15	25 lbs.	23 75
2 lbs.	2 25	50 lbs.	44 75
5 lbs.	5 40	100 lbs.	84 00

"EVERGREEN" Lawn Seed

This mixture has been prepared for those requiring a moderate-priced lawn grass seed. It is quick growing and will produce a good turf in a short period of time. We believe it is unequaled at the price.

1 lb.	\$0 80	25 lbs.	\$17 50
2 lbs.	1 55	50 lbs.	32 50
5 lbs.	3 75	100 lbs.	60 00
10 lbs.	7 25		

"TUF-TURF" Lawn Seed

This is a mixture particularly suited to shady areas. It is composed of grasses that will thrive under the shade of trees and buildings, where little sun reaches the ground and in places where ordinary grasses will not succeed. Kentucky Blue Grass forms the basis for this mixture, plus a good proportion of several other grasses best suited to shady places.

1/2 lb.	\$0 50	10 lbs.	\$ 8 75
1 lb.	0 95	25 lbs.	21 25
2 lbs.	1 85	50 lbs.	40 00
5 lbs.	4 50	100 lbs.	75 00

"MERION BLEND" Lawn Seed

This mixture is particularly suited for close mowing. Its drought resistance is unusually high, which is a valuable factor in the dry summers recently experienced over much of the country. Merion Blend produces a much better turf throughout the entire growing season than Kentucky Blue Grass mixtures.
